## 1 INTRODUCTION

Dear Customer,

Thank you for having chosen our **generator**.

**In your interests, we invite you to follow and observe the instructions in this manual to ensure the highest level of efficiency and duration of the unit.**

**IMPORTANT: failure to observe the instructions in this manual will void the warranty conditions.**

## 2 SAFETY WARNINGS

### IMPORTANT

For safety and for proper operation, carefully read this **TECHNICAL MANUAL** before installing and starting the generator.

**The manual is an integral and essential part of the generator and must accompany it from installation until disposal. The generator must be used for the purpose for which it was strictly intended and any liability by the Manufacturer for damages to people, animals or property due to lack of maintenance or for improper use, is excluded.**

### Safety of the thermal power plant

For safety purposes, the qualified technical personnel in charge of running the system must consider the following requirements:

- Follow the accident prevention and environmental safety regulations in force.
- Ensure the generator installation in the thermal power plant complies with the standards in force.
- Ensure that the electrical and hydraulic system complies with the standards in force.
- Ensure that the boiler room complies with the standards in force and is sufficiently ventilated.
- Ensure that the boiler fumes are conveyed outside the thermal power plant through a flue compliant with the standards in force.
- Ensure that the acidic condensation that may develop during system start-up, is evacuated outside the thermal power plant after a neutralisation process in compliance with the standards in force.
- Ensure that there is no danger due to frost inside the thermal power plant.

### System check

Before switching on the generator for the first time, a duly qualified technician must perform a check at the central heating plant and update the system log once the check is over.

### Periodic verifications

The generator must be periodically checked by a duly qualified technician (maintenance worker), who should update the system log once the check is over.

### Danger of explosion

Routine and extraordinary maintenance must be entrusted to **professionally qualified personnel** with the purpose of promptly detecting any damage to the generator's pressurised body and the safety and control accessories.

### Danger deriving from the fuel

Sensing the presence of fuel in the thermal power plant, it is appropriate to follow the precautions below to avoid the risk of explosions and fires:

- Do not smoke or cause sparks.
- Do not turn on lights or electrical devices in general (mobile phones).
- Open doors and windows.
- Close the fuel shut-off valve normally placed outside the thermal power plant.
- Disconnect the electrical power supply by using the switch normally placed outside the thermal power plant.

### **Danger of burns**

During normal operation, the generator has hot parts that, upon accidental contact without suitable personal protection, can cause serious burns. Potentially hot parts include:

- Accessories and valves connected to the generator.
- Door and smoke chamber.

### **Danger from fumes**

An incorrect adjustment of the closing door or an insufficient draught in the flue can leave fumes inside the thermal power plant, causing fatal intoxication deriving from carbon monoxide which, by its nature, is colourless and odourless. Therefore, ensure the generator is properly installed and adjusted and the presence of ventilation openings in the thermal power plant are compliant with the regulations in force.

### **Repairs**

Any generator repair must be carried out or authorised by the manufacturer in order to avoid risks to people and property, as well as to prevent **voiding the Warranty Conditions being** . Generator maintenance must be entrusted to competent personnel.

### **Spare parts**

In order to ensure maximum safety and reliability, it is essential that all removable defective accessories and parts are replaced with **Original Spare Parts** supplied by the Manufacturer.

---

### 3 GENERAL WARNINGS

Each generator is provided with a **manufacture plate** that can be found in the envelope with the boiler documents. The plate lists:

- Serial number or identification code;
- Rated thermal output in kcal/h and in kW;
- Furnace thermal output in kcal/h and in kW;
- Types of fuels that can be used;
- Max operating pressure.

A **manufacture certificate** is also provided which certifies the hydraulic test positive performance.

The installation must be performed in compliance with the regulations in force by **professionally qualified personnel**. The term “professionally qualified personnel” means persons with specific technical skills in the sector of heating system components.

Incorrect installation may cause damage to persons, animals or objects for which the manufacturer cannot be held responsible.

**At the first start up**, all regulation and control devices positioned on the control panel should be checked for efficiency. The **guarantee** shall be valid only upon compliance with the instruction given in this manual.

Our boilers have been built and tested in observance of EEC requirements and, as a consequence, CE-marked. EEC directives are as follows:

- **Directive on Gas** 2009/142/CE
- **Directive on Output** 92/42/EEC
- **Directive on Electromagnetic Compatibility** 2004/108/CE
- **Directive on Low Voltage** 2006/95/CE

**IMPORTANT:** This boiler has been designed to heat hot water at a temperature inferior to the boiling temperature at atmospheric pressure and must be connected to a heating plant and/or a domestic hot water plant within the limits of its performance and output.

**ATTENTION: REX F, REX K F and REX DUAL F models featuring aluminum finned extrusions in their fire tubes (Fin-e patented) are suitable exclusively for use with gaseous fuels.**

## 5 INSTALLATION

Before **connecting** the boiler, perform the following operations:

- Thoroughly clean all the **system pipes** in order to remove any foreign matter that could affect correct operation of the boiler;
- Check that the **flue** has an **adequate draught**, that there is no narrowing of passages and that it is free from debris; also check that other appliances do not discharge into the flue (unless designed to serve several utilities).

**See the regulations in force.**

### 5.1 THERMAL PLANT

#### 5.1.1 BOILER ROOM

As a rule, regulations in force should be always observed. Premises in which boilers will be installed should be sufficiently ventilated and guarantee access for ordinary and extraordinary maintenance operations.

#### 5.1.2 FLUE

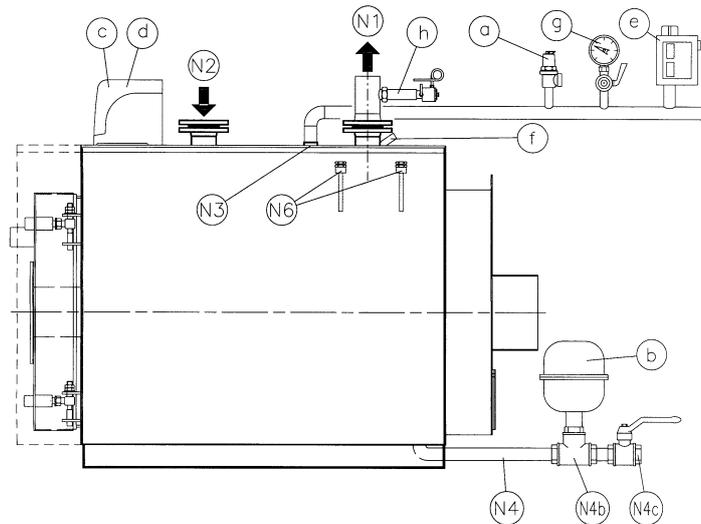

**The smokestack must be dimensioned as to applicable regulations.**

## 5.2 HYDRAULIC CONNECTION

### 5.2.1 HOT WATER HEATING SYSTEM WITH CLOSED EXPANSION VESSEL - Furnace output ≤ 300.000 kcal/h

The generator must be provided with:

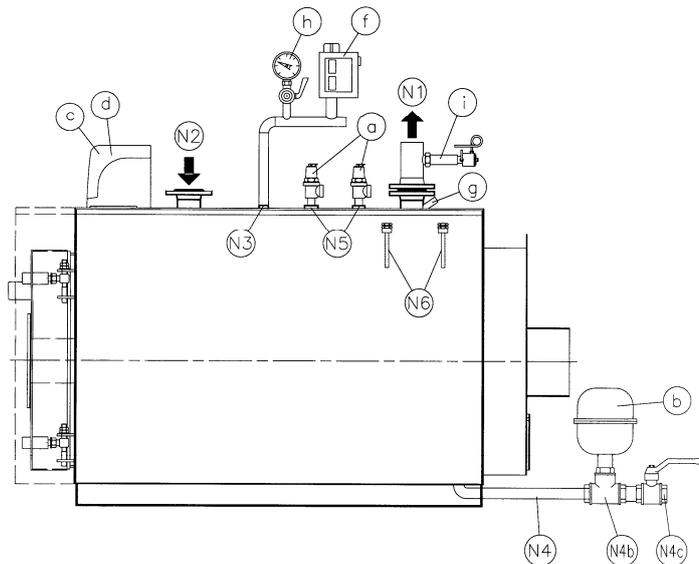

- a - Safety valve
- b - Expansion vessel (connected with a hose ≥ 18 mm diameter)
- c - Regulation thermostats
- d - Safety thermostat
- e - Cut-off pressure switch
- f - Well for control thermometer
- g - Pressure gauge with flange for control pressure gauge
- h - Heat discharge valve or fuel on-off valve.
- N1 - Flow
- N2 - Return
- N3 - Instrument fitting
- N4 - Lower fitting:
  - N4b expansion vessel fitting
  - N4c filling/drain
- N6 - Bulb wells (thermometer, pump consent thermostat, regulation thermostat, safety thermostat).

### 5.2.2 HOT WATER HEATING SYSTEM WITH CLOSED EXPANSION VESSEL - Furnace output > 300,000 kcal/h

The generator must be provided with:

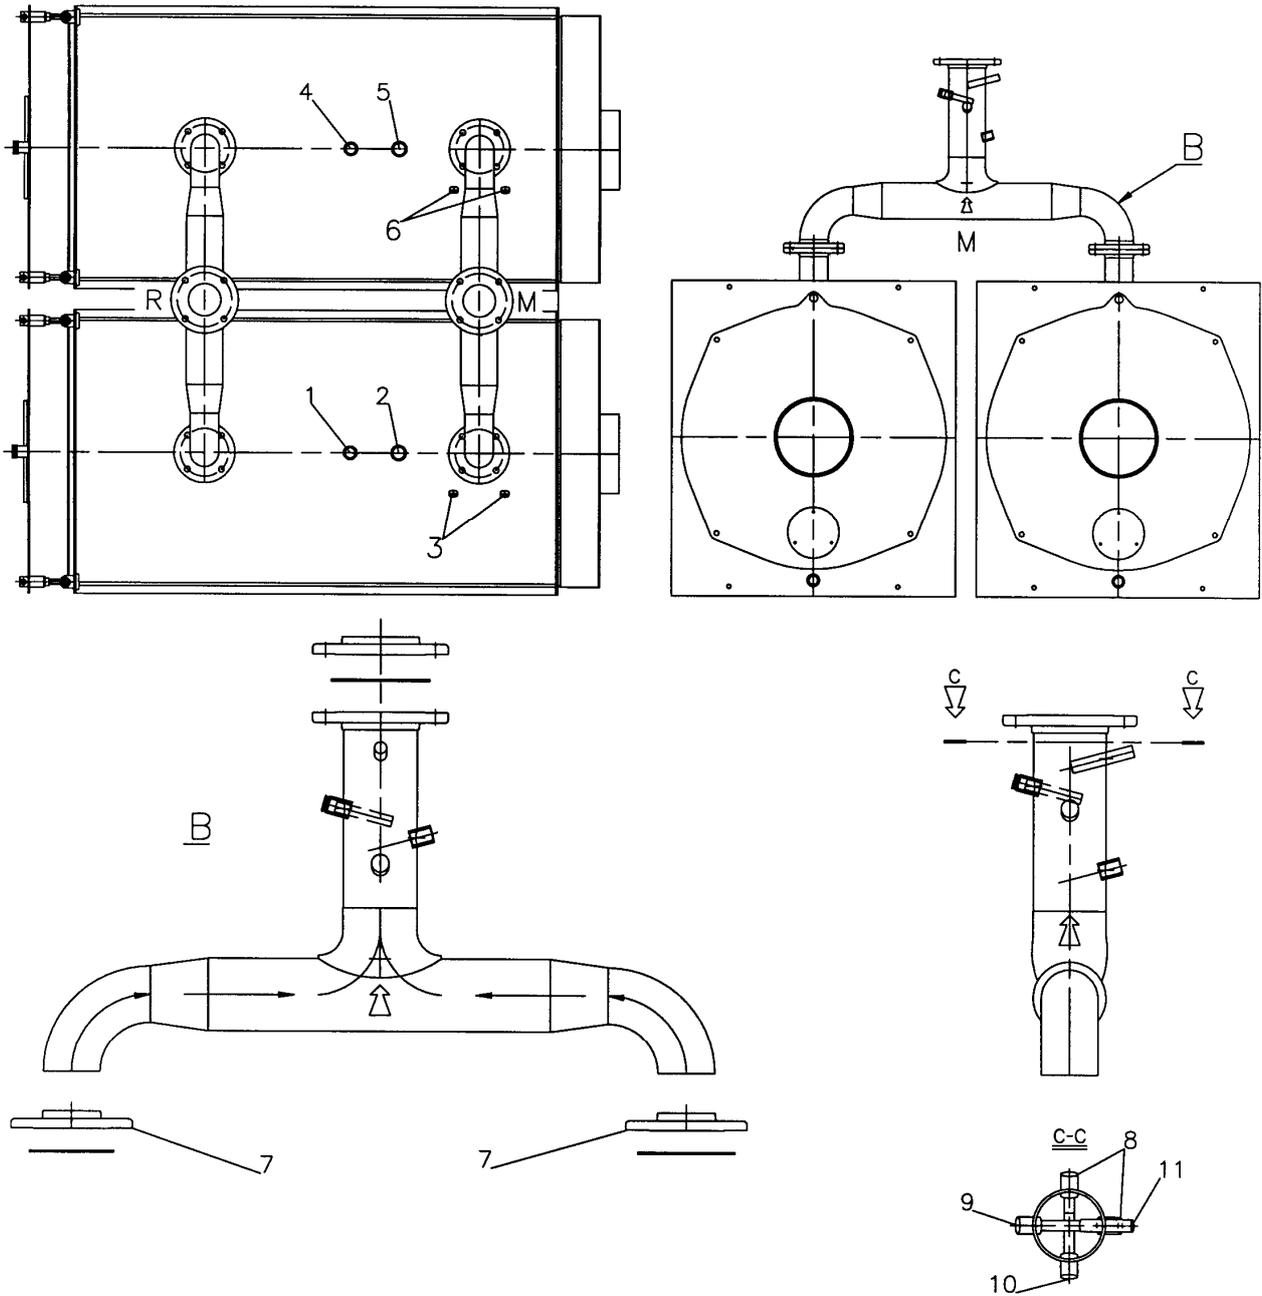

- a - 1 safety valve
- 2 safety valves if output is > 500,000 kcal/h
- b - Expansion vessel
- c - Regulation thermostats
- d - 1st safety thermostat
- f - Cut-off pressure switch
- g - Well for control thermometer
- h - Pressure gauge with flange for control pressure gauge
- i - Heat discharge valve or fuel on-off valve
- N1 - Flow
- N2 - Return
- N3 - Instrument fitting
- N4 - Lower fitting:
  - N4b expansion vessel fitting
  - N4c Filling/drain
- N5 - Safety valves fitting
- N6 - Bulb wells (thermometer, pump consent thermostat, regulation thermostat, safety thermostat)

Ensure that the hydraulic pressure measured after the reduction valve on the supply pipe does not exceed the operating **pressure specified on the rating plate of the component** (boiler, heater etc.).

- As the water contained in the heating system increases in pressure during operation, ensure that its maximum value does not exceed the maximum hydraulic pressure specified on the component rating plate.
- Ensure that the safety valve outlets of the boiler and hot water tank, if any, have been connected to an exhaust funnel in order to prevent the valves from **flooding the room** if they open.
- Ensure that the pipes of the water and heating system **are not used as an earth connection** for the electrical system as this can seriously and very rapidly damage the pipes, boiler, heater and radiators.
- Once the heating system has been filled, you are advised to close the supply cock and keep it closed so that **any leaks from the system** will be identified by a drop in hydraulic pressure indicated on the system pressure gauge.

### 5.2.3 REX DUAL/REX DUAL F (side by side) 80÷260 POSITIONING INSTRUMENTS

#### Key

1. Pressure switch fitting
  2. 1<sup>st</sup> safety valve fitting or thermal drainage 1<sup>st</sup> safety
  3. 1<sup>st</sup> boiler circulator consent thermostat and safety thermostat bulb wells
  4. Manometer fitting with control manometer flange
  5. 2<sup>nd</sup> safety valve fitting or thermal drainage 1<sup>st</sup> safety
  6. 2<sup>nd</sup> boiler circulator consent thermostat and safety thermostat bulb wells
  7. Flanges to weld after the definitive and correct positioning of the boilers
  8. 1<sup>st</sup> and 2<sup>nd</sup> boiler fuel valve bulbs wells
  9. Boiler thermometer bulb well
  10. 1<sup>st</sup> and 2<sup>nd</sup> boiler bi-thermostats bulbs well, digital regulator thermal-resistance (optional)
  11. Temperature test bulb wells
- M. Flow  
R. Return

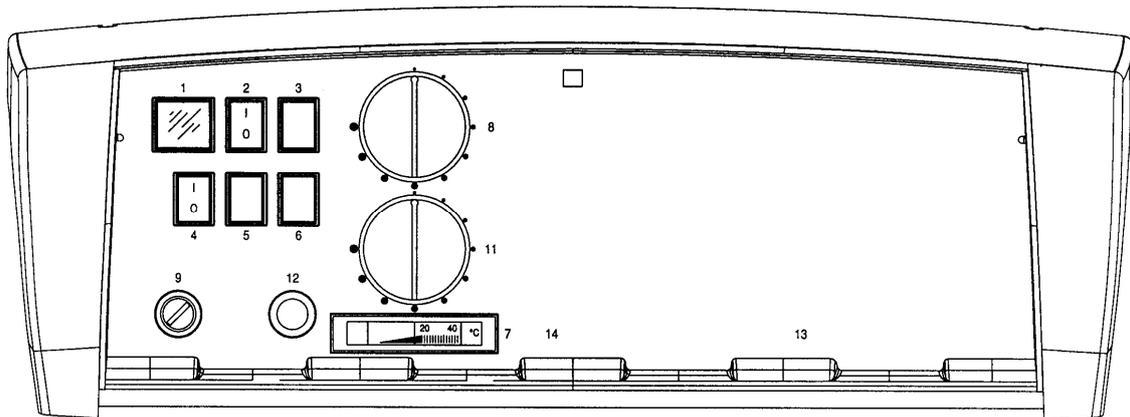

---

### 5.3 ELECTRICAL CONNECTION

Electrical systems of thermal plants designed only for heating purposes **must comply with numerous legal regulations which apply to in general as well as specifically to each application or fuel type.**

### 5.4 REX/REX F/REX K/REX K F OPTIONAL CONTROL PANEL

The control panel (optional) with the boilers is made of self-extinguishing plastic and houses the regulation and safety instruments:

#### KEY

- 1 PANEL LIVE
- 2 BURNER SWITCH N. 1
- 4 HEATING PUMP SWITCH
- 7 BOILER THERMOMETER
- 8 LIMIT CONTROL THERMOSTAT
- 9 SAFETY LIMIT THERMOSTAT N. 1
- 11 BURNER HIGH/LOW THERMOSTAT

The upper part of the control panel can be rotated to gain access to the terminal board and uncoil the thermostat and thermometer capillaries. A copy of the wiring diagram is contained inside the control panel cover. The **regulation thermostats** have an operating range from 60° to 100° and can be set by the user by means of the front knob.

**Safety thermostats** has a fixed setting of 110°C and can be manually reset in accordance by law.

**Circulator consent thermostat** located inside the panel can be adjusted from 0°C to 90°C using a tool and is factory-set at 50°C, while its differential deviation is 6°C. Thanks to this thermostat, the circulator is inactive when the temperature is below 50°C to avoid dangerous exhaust condensation.

For correct installation, refer to the boiler casing assembly instructions.

#### WIRING DIAGRAM

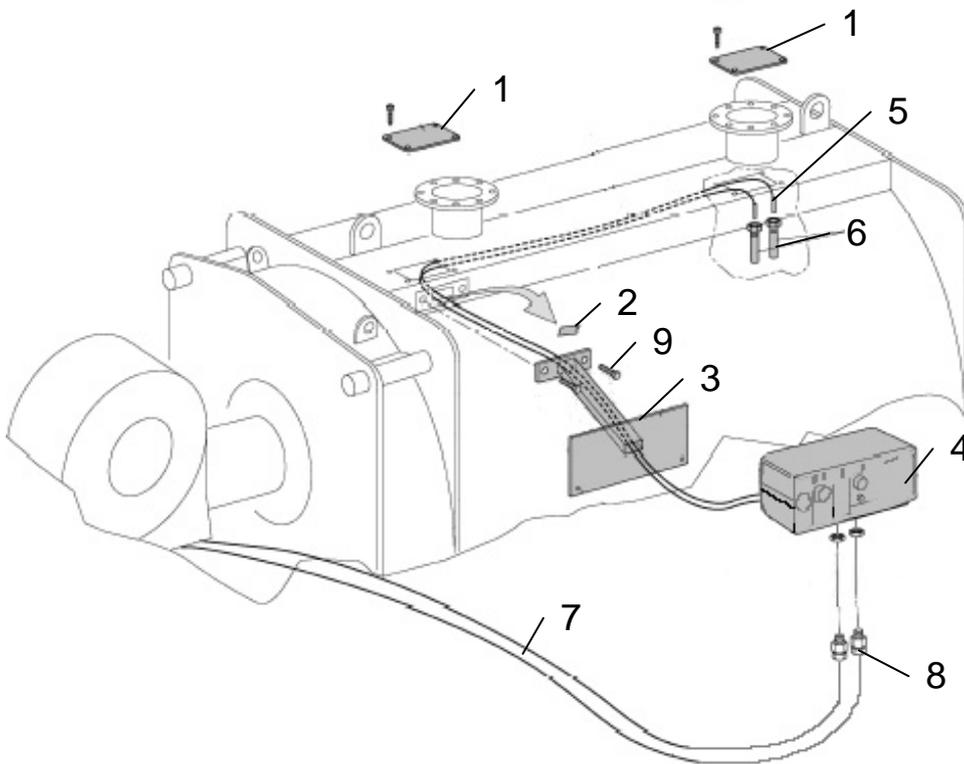

*Refer to the diagram supplied with the specific switchboard.*

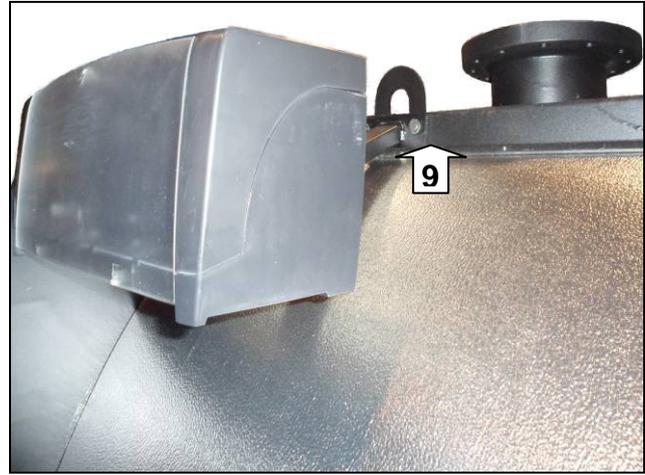

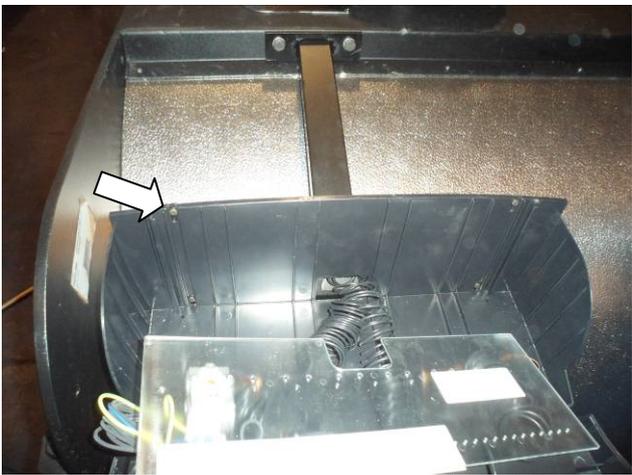

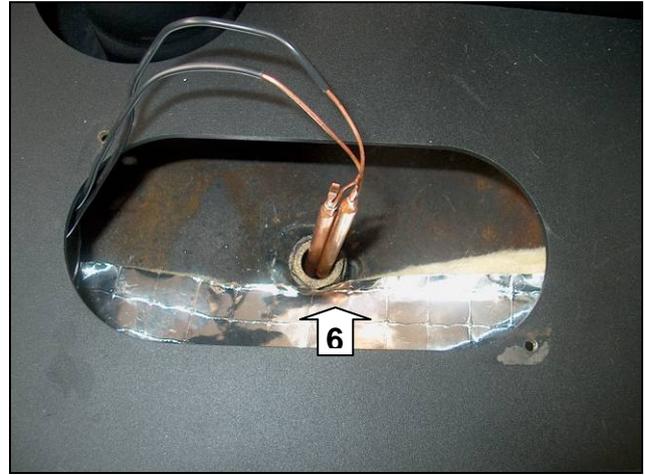

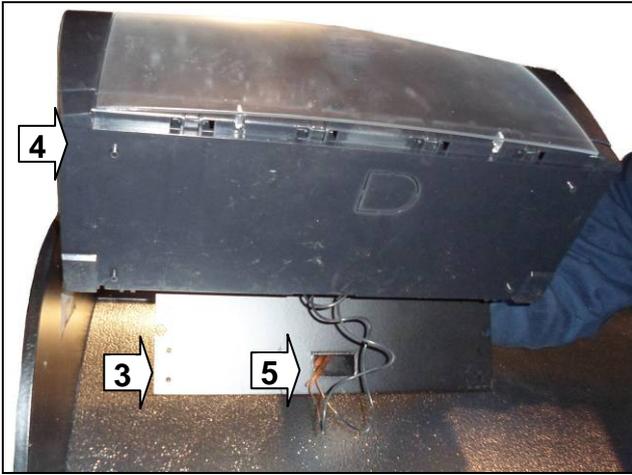

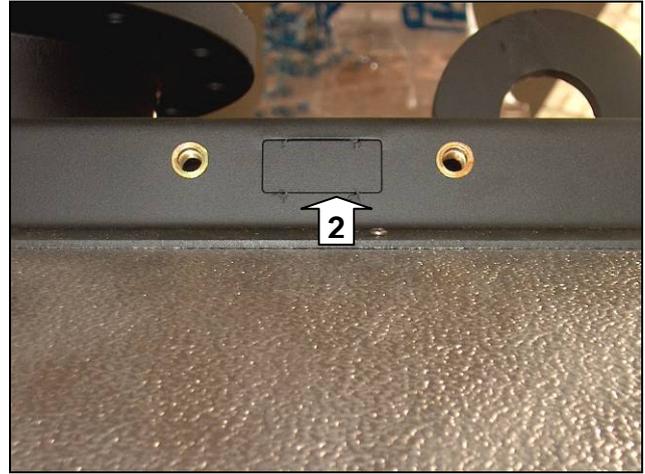

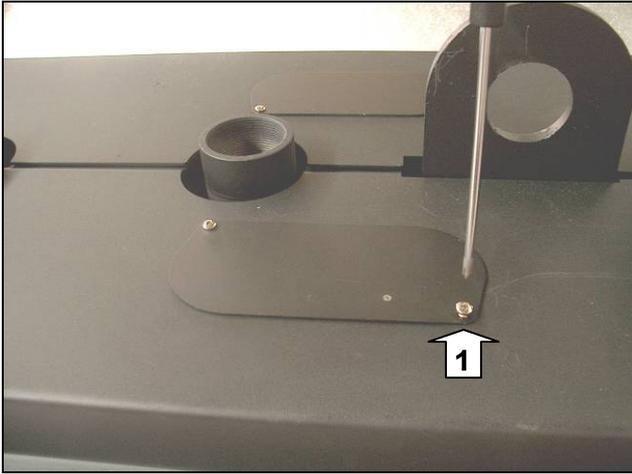

---

## 5.5 INSTALLATION OF REX 140÷350 BOILER CONTROL PANEL

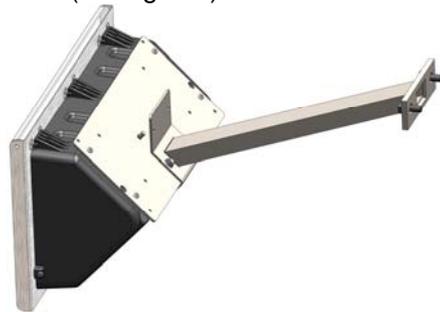

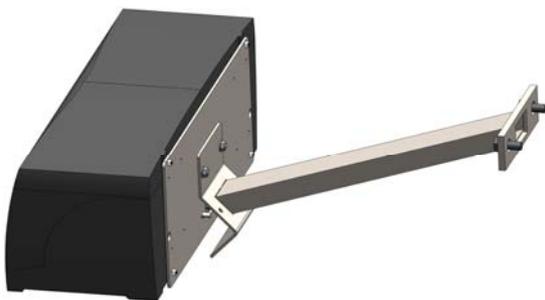

*NOTE: the control panel picture is purely indicative as it may vary according to the type of panel installed.*

- a. Choose the side on which to install the control panel (RH or LH), remove the covers (1) and push in the pre-cut opening (2).
- b. Pick up the kit of the arm complete with bracket (3).
- c. Open the control panel (4) and cut the preset window on the rear side.
- d. Pass the bulbs (5) of thermostats and thermometer through the window and screw them in the square pipe of the bracket and slide them in the protective tube through top openings until they reach the wells (6). Lock them using the special locking springs.
- e. Connect the cables of burner (7) to the control panel using a protective sheath and lock them with the cable glands (8).
- f. Secure the control panel to the bracket (3) using the kit supplied.
- g. Use the two screws (9) and fasten the arm-control panel group to the top section of the boiler.
- h. Assemble the covers (1).

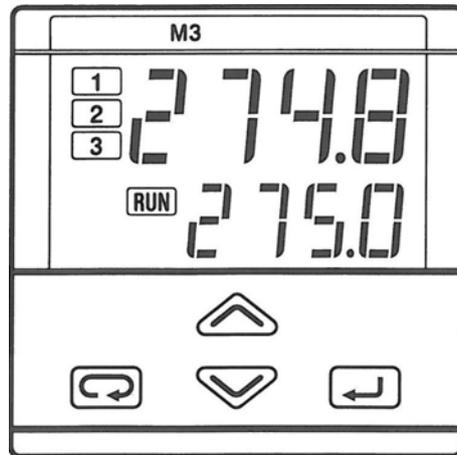

The bracket provided, which is equipped with a 2-hole shaped plate, enables the user to mount the panels with two inclinations, and hence to choose the position he/she prefers (see figures).

## 5.6 REX/REX F 400-600 CONTROL PANEL

The generators are equipped with electric board (IP 55 protection level), which are already assembled to the different boiler accessories.

### ELECTRONIC CONTROLLER

On the controller appear the water temperature in the boiler and can setting three values:

1. OP1 – ON/OFF burner;
2. OP2 – Second stage burner;
3. OP3 – Anticondensate pump.

To change the value:

#### **OP1:**

On main screen under the water temperature, can read the value of ON/OFF burner, to change use the button  and  for increase o decrease, wait 2 seconds and the parameter will be saved automatically.

#### **OP2:**

From the main screen push  and the parameter A2S.P is the value of the second stage burner; change it with the arrows   and confirm with .

#### **OP3:**

From the main screen push  and after  and the parameter A3S.P is the value of the stop anticondensating pump; change it with the arrows   and confirm with .

**Note:** For more information, refer to the specific manual inside the electrical panel.

### WIRING DIAGRAM

Refer to the diagram supplied with the specific switchboard.

## 5.7 REX DUAL/REX DUAL F OPERATING PRINCIPLES

The boiler consists of 2 units of same capacity and one only control panel for both units. Each unit can work independently and the boiler can be operated partially. This means that all panel controls (burner switches, thermostats and thermometers) have been doubled. See paragraph 4.5 on connection. As an example, bi-thermostats TR1 and TR2 can be adjusted so that there is a 10°C intervention difference between each other (do not forget that knobs have a 42° to 87° regulation range with a 1/2 turn rotation about). Flow water temperature after 2 equal flows have been mixed corresponds to mean flow temperature of two units

### 5.7.1 REX DUAL/REX DUAL F OPTIONAL CONTROL PANEL

**NOTE:** for boilers with two different control panels, see Par. 5.4

The optional control panel is made of plastic with IP40 protection degree and houses the regulation and safety instruments:

The upper part of the control panel can be rotated to gain access to the terminal board and uncoil the thermostat and thermometer capillaries. A copy of the wiring diagram is contained inside the control panel.

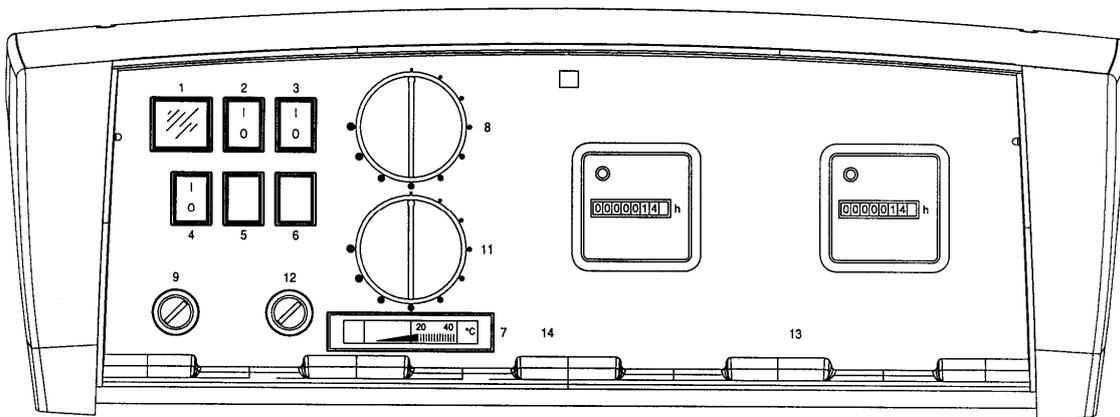

**The regulation bi-thermostats** have an operating range from 42° to 87° and can be set by the user by means of the front knob. The temperature differential of each bi-thermostat is fixed and approx. 7°C.

**Safety thermostats** have a fixed setting of 110°C and can be manually reset in accordance by law.

**Circulator consent thermostats** located inside the panel can be adjusted from 0°C to 90°C using a tool and are factory-set at 45°C, while their differential deviation is 6°C. Thanks to these thermostats, the circulators are inactive when the temperature is below 45°C to avoid dangerous exhaust condensation.

For correct installation, refer to the boiler casing assembly instructions.

**Note:** both hour meters start each time their own burner starts. It is recommended that the numbers displayed by both hour meters are monitored . This helps guarantee that burners have almost the same number of working hours.

#### KEY

- 1 PANEL LIVE
- 2 BURNER SWITCH N. 1
- 3 BURNER SWITCH N. 2
- 4 HEATING PUMP SWITCH
- 7 BOILER THERMOMETER
- 8 CONTROL BI-THERMOSTAT N. 1
- 9 SAFETY LIMIT THERMOSTAT N. 1
- 11 CONTROL BI-THERMOSTAT N. 2
- 12 SAFETY LIMIT THERMOSTAT N. 2
- 13 HOURS RUN METER BOILER N. 1
- 14 HOURS RUN METER BOILER N. 2

#### WIRING DIAGRAM

Refer to the diagram supplied with the specific switchboard.

---

## 5.8 DOOR

### 5.8.1 DOOR OPENING

The door is adjusted in the factory with standard opening to the left (s) and with hinges on the right (d).

**CAUTION: it is dangerous to unscrew the ring nuts (8d) on the side of the hinges to avoid causing the door to detach, with possible serious damage to people and property.**

### 5.8.2 DOOR OPENING REVERSAL (to the right)

*Only for models listed in the Technical Data table*

Proceed as follows to reverse the opening direction of the door:

#### **Door with ferrules perforated on both sides**

1. **Screw the left perforated ferrules (8s)** so that the door seal gasket is pressed in the same way as the right part. Bring the conical washers (10s) of the left tie-rods close to the mechanical tubes (9s) of the door and tighten the nuts (7s) using a suitable wrench.
2. On the right opening side, loosen the nuts (7d) and free the conical washers (10d) from the mechanical tubes (9d) of the door.

#### **Door with wrench ferrules, hinge side**

**IMPORTANT NOTE:** In models equipped with wrench-adjustable ferrules (8d), these must always be mounted on the hinges to prevent the door from being accidentally opened through the lever (12).

In this case, proceed as follows:

3. Proceed as indicated in point 1.
4. Cross-change the wrench ferrule of a hinge (8d) with the opposite perforated ferrule (8s), after loosening the locking nuts on the tie rods and freeing the conical washers.
5. On the left hinge side, fasten the conical washer (9s) onto the door using the nut (10s).
6. Proceed with the other two ferrules following the procedure described in points 4 and 5.

**CAUTION: When cross-changing ferrules, always make sure that the other two ferrules are fastened, so that they hold the door.**

7. Check the correct adjustment of the tie-rods and hinges ensuring that, during closure, the seal gasket is **evenly pressed in the centre on the whole circumference** (see figure).

If necessary, adjust as described in the next par.

### 5.8.3 DOOR ADJUSTMENT (opening on the right)

#### Vertical adjustment

1. With the door ajar, loosen the counter-nuts (5s) of the hinge units.
2. Act on the adjustment nuts (4s) to lift or lower the door by centring the gasket on the stop plate (see figure), then block the counter-nuts (5s).
3. Close the door and centre the tie-rod (1d) on the mechanical tube (9d), proceeding as in point 2.

#### Horizontal adjustment

Close the door using the lever and check that there is equal distance on both sides, between the stop plate and the band.

Otherwise, proceed as follows:

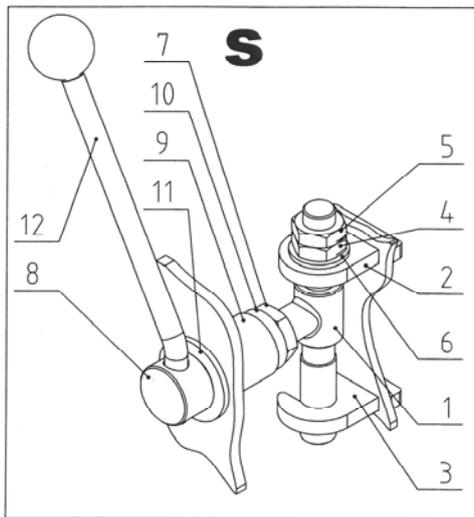

1. With the door ajar, loosen the locking nuts (7s) of the hinge units.
2. Act on the ferrule (8s) to adjust the distance depth-wise.
3. Screw the nuts (7s) and block the conical washers on the mechanical tubes.

Check the proper adjustment in depth ensuring that the door, manually pushed up to the stop plate, naturally returns remaining ajar. This is to ensure the hinge side fume seal.

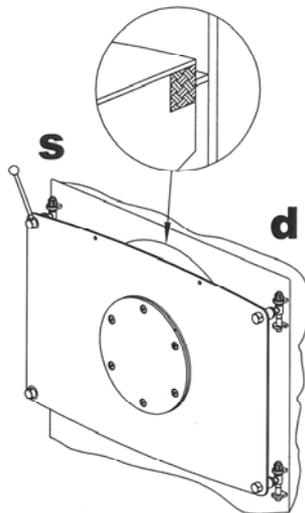

**For any problems related to the reversal and adjustment of the door, we recommend contacting our local Authorised Technical Assistance Centre.**

**IMPORTANT: Incorrect door adjustment with consequent damage to people and property voids the warranty conditions.**

OPENING UNIT

## 5.9 BURNER CONNECTION

Before installation you are advised to thoroughly clean the inside of all the fuel supply system pipes in order to remove any foreign matter that could affect correct operation of the boiler. See technical specification tables and check the max pressure value inside the furnace. The value found on the table may also increase by 20% if heavy oil is used instead of gas or light oil; furthermore the following checks should also be carried out:

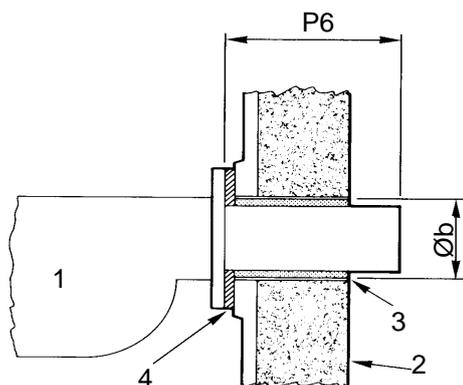

- a) Check the internal and external seal of the fuel supply system;
- b) Regulate the fuel flow according to the power required by the boiler;
- c) Check that the boiler is fired by the correct type of fuel;
- d) Check that the fuel supply pressure is within the values specified on the burner rating plate;
- e) Check that the fuel supply system is sized for the maximum flow rate necessary for the boiler and that it is provided with all control and safety devices provided for by the regulations referred to above;
- f) Check that the boiler room vents are sized in order to guarantee the air flow established by the regulations referred to above and that they are in any case sufficient to obtain perfect combustion.

In particular, when using gas:

- g) Check that the feeding line and the gas ramp comply with the regulations in force;
- h) Check that all the gas connections are sealed;
- i) Check that the gas pipes are not used as earth connections for electrical appliances.

If the boiler is not going to be used for some time, close the fuel supply cock or cocks.

**IMPORTANT: check that the air spaces between the burner draught tube and the manhole are suitably filled with thermoinsulating material.** The boiler is supplied with a piece of ceramic rope. Should this not suit the burner used, use a braid of different diameter but same material.

KEY:

1. Burner
2. Manhole
3. Thermoinsulating material
4. Flange

All details on the draught tube length (**P6**), the diameter of the burner hole (**Øb**) and the pressurization are included in the par. Technical Specifications.

**ATTENTION: when using oil or bio-gas for operation, the door must have cement insulation and special tie rods. Any alterations and/or lack of communication during the selling phase shall nullify the warranty conditions.**

---

## 6 ASSEMBLY

### 6.1 REX K/REX K F ASSEMBLY

Ensure that installation premises floor is even and perfectly horizontal.

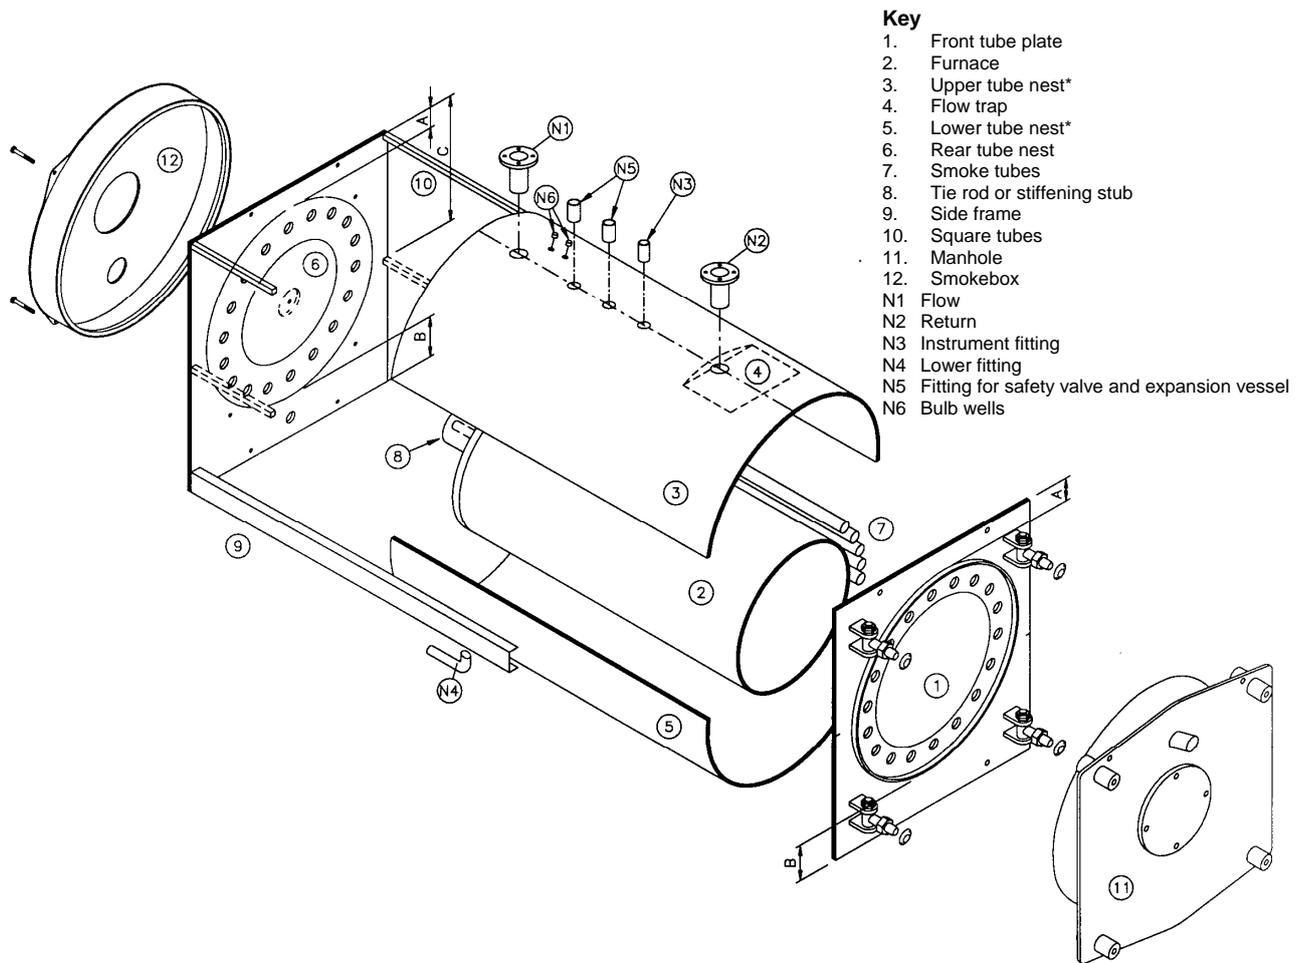

For perfect welding, use acid or rutile cored electrodes (check codes AWS E6020 or AWS E6013 or E44LA3 or E44LC3).

- a) Put the boiler rear plate (1) on the floor with the hinges pointing down and ensure that it is perfectly levelled (mark the middle of the plate sides in order to position correctly the furnace and the tube nest.
- b) Position the furnace (2) on the internal edge of the front plate (1) keeping the longitudinal welding of the furnace in the lower part of the boiler. **Ensure that plate and furnace are perfectly perpendicular when coupling them.**
- c) Weld the furnace (2) onto the front plate (1) along the outer circumference.
- d) Add the top tube nest part (3)\* (the return stub which can be recognised by its flow trap (4) welded inside the tube nest, must be close to the front tube plate). **For positioning, ensure that the flanged stub hole axis is aligned with the sign previously marked on the plate middle.** For easy centering, check height **A** between the tube nest edge and the plate edge. Spot-weld the middle only.
- e) Position the lower tube nest (5)\* in respect of height **B** and spot-weld it only in the lower middle part of the rear plate (1).
- f) Spot-weld the two tube nest parts (3)\* and (5)\*
- g) Position the rear tube plate (6) and insert the tie rod or the stiffening stub (8) in the furnace.
- h) Weld the rear tube plate (6) and the tie rod or stiffening stub (8), carefully avoiding any damage to the four threaded rivets or screws which will be used to secure the smokebox.
- i) Weld all the nest (3)\* and (5)\* onto the rear plate (1).
- j) Now, smoke tubes (7) can be inserted and welded on the rear plate tube (6) keeping the boiler in upright position or (but welding will be more difficult) horizontally; the choice will depend on the size of premises and the equipment available to turn the boiler upside down. **Caution: smoke tuber (7) must protrude 3 mm from the front plate (1) and approx. 10 mm from the rear plate (6).**

<b>NB: the condensate groove for the F version (with extruded aluminium) must be positioned in the lower section.</b>
---

- k) Spot-weld the drain (N4) and ensure that it is perpendicular to the front plate (1) and parallel to the tube nest.
- l) Position the boiler horizontally. For this reason, a lifting hook is supplied that can be conveniently welded to the tube nest in order to simplify the boiler overturning. Remember not to have this hook protruding from the casing.
- m) Weld the two parts of the tube nest (3)\* and (5)\* longitudinally as well as the furnace inside (2) to the front plate (1); you can simplify this operation by using rolls for rotating.
- n) Weld both ½" couplings (N6) onto the tube nest (3)\* after having ensured that the bulb sheaths inclination is correct to avoid that sheaths are not blocked by smoke tubes; remove sheaths when welding. Weld the two flanged stubs (N1) and (N2) for flow and return, ensuring that flanges are perfectly horizontal. Weld the instrument fitting (N3) and fittings (N5) if included in the supply.
- o) Weld smoke tubes (7) onto the rear plate (1).
- p) Ensure that plate shapes (1) and (6) have not been altered and weld on plate surface the side frames (9).
- q) Weld the square tubes (10) that support the casing and, if part of the supply, weld also the side ones keeping height **C**.
- r) Carry out the hydraulic test under pressure. **FILL THE GUARANTEE WITH THE TEST DATE.**
- s) Install the manhole (11) and the smoke box (12).
- t) Touch-up visible parts by using the paint supplied.

**\* NB: ref. 3-5, single piece up to mod. 25**

## 6.2 REX/REX F/REX K/REX K F BOILER CASINGS AND CONTROL PANEL

- 1) Wrap the fibreglass around the boiler body and use the supplied strap to secure it (see fig.).

DIAGRAM OF PLASTIC STRAP LOCKING  
TO SECURE THE FIBREGLASS  
TO THE BOILER SHELL

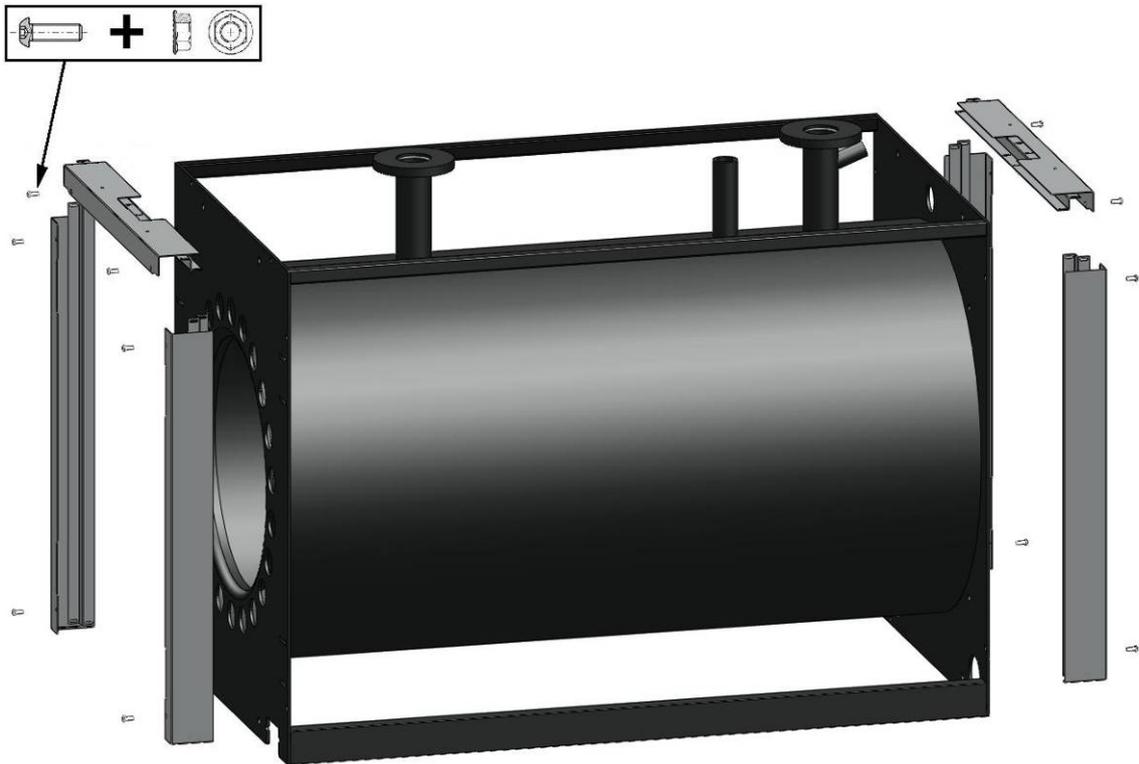

- 2) Prepare the staves by inserting the four stoppers, as shown in the figure.

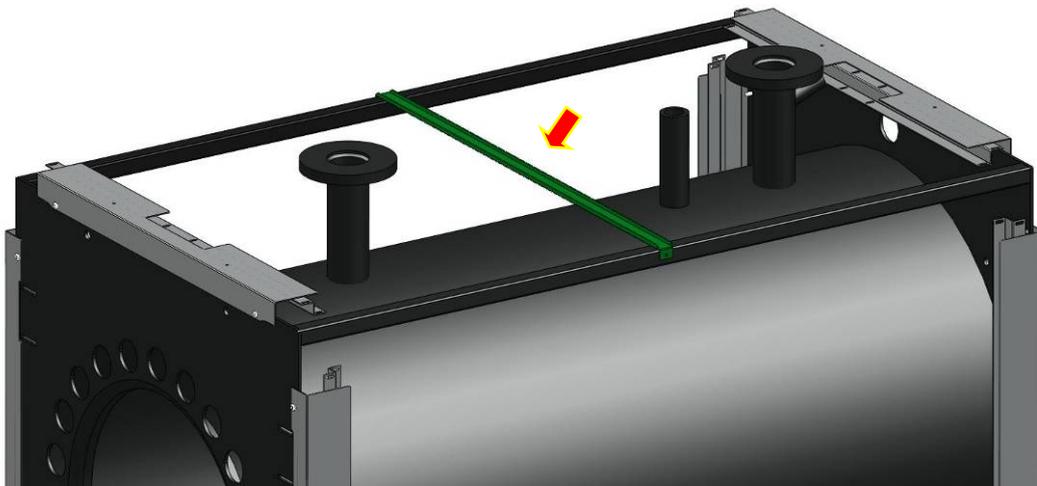

---

3) Fasten the uprights and the beams to the plates by means of appropriate screws and nuts.

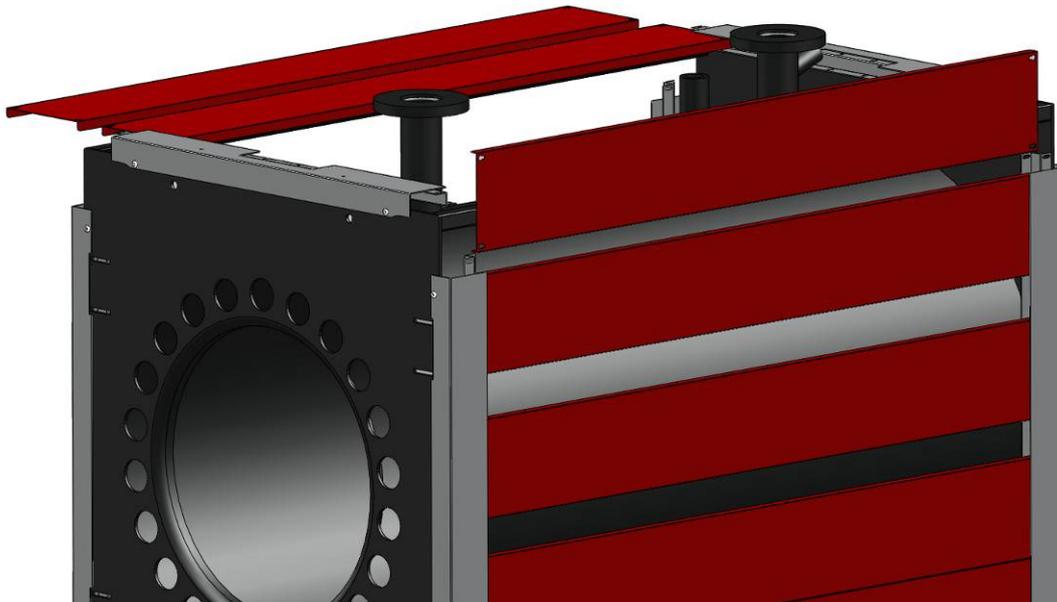

NOTE: the beam shown in the figure, if supplied in the package, must be placed between the two tube panels in order to support the staves.

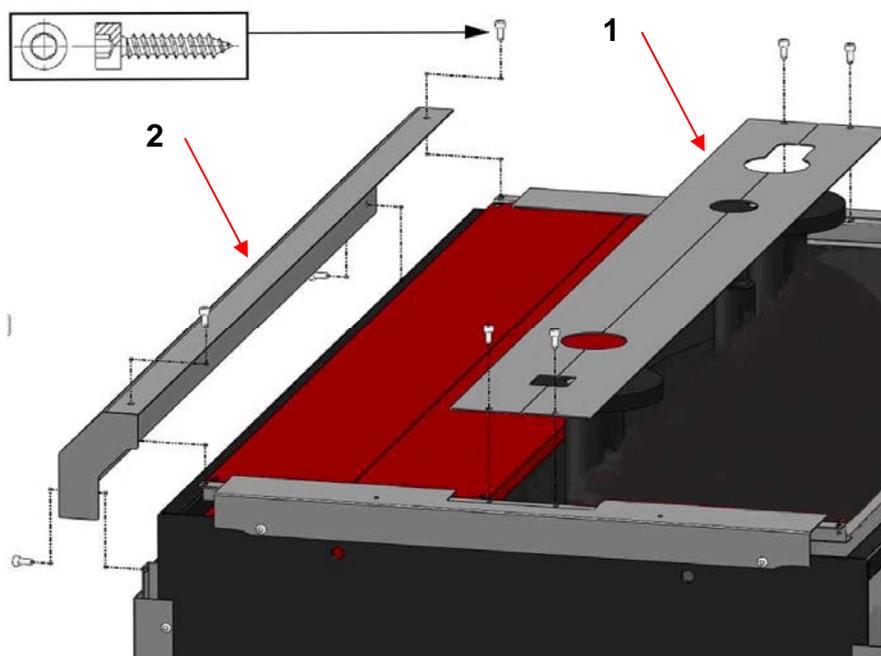

- 
- 4) Insert the staves, with the previously installed stoppers, between the uprights and the beams, as shown in the figure.

**PLEASE NOTE:** do not cover the upper corner on the manhole side; this is required for the subsequent installation of the control panel and its bulbs.

- 5) After inserting the lags and fastening the relevant central masks (1), install the closing profiles (2) using the self-tapping screws, on the side opposite the manholes.

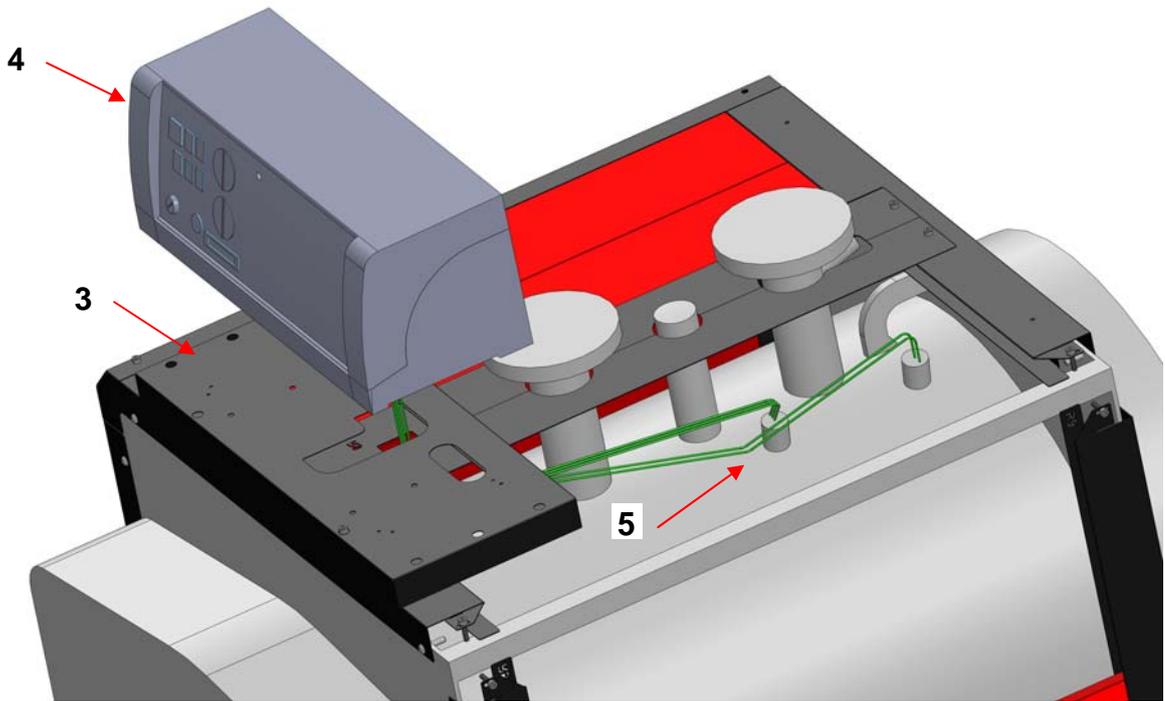

---

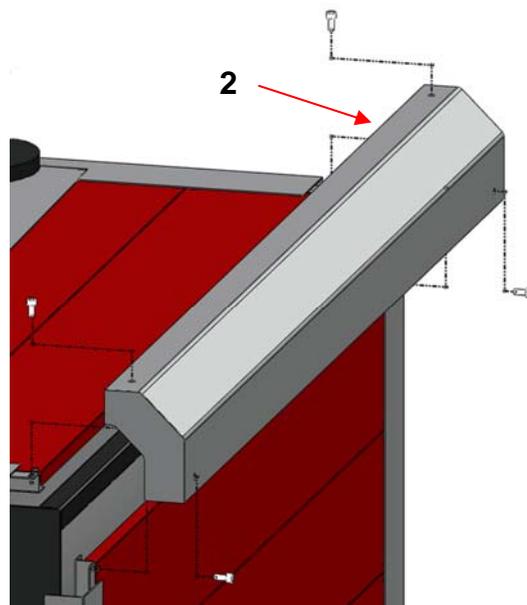

## CONTROL PANEL INSTALLATION

*NOTE: the control panel picture is purely indicative as it may vary according to the type of panel installed.*

- 6) Install the control panel support (3) included in the kit on the front beam of the boiler.
- 7) Place the control panel (4) onto the support (3) and insert the boiler adjustment thermostats capillary tubes, the safety thermostat capillary tubes, the circulator consent thermostat capillary tubes and the boiler thermometer capillary tubes through the relevant openings, until the bulb-holding manholes (5) on the shell have been reached.

- 8) Fasten the control panel onto the support using the screws provided.
- 9) Finish inserting the lags and installing the closing profiles (2) using the self-tapping screws on the man-hole side.

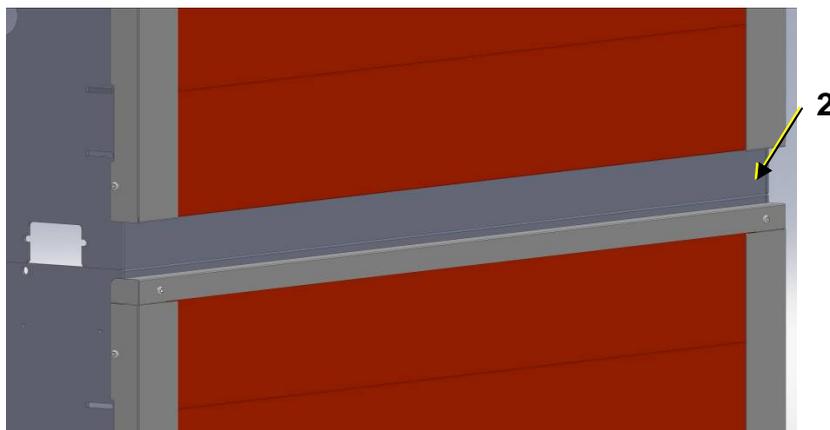

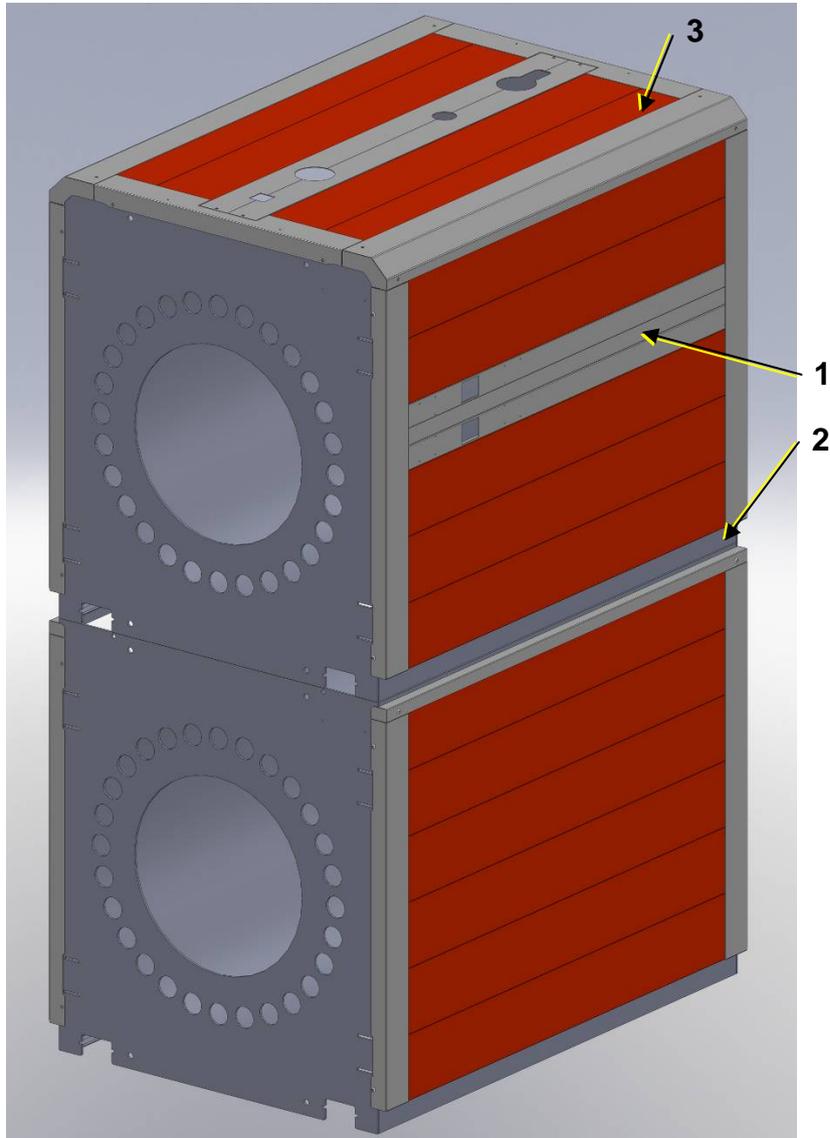

---

### 6.3 REX DUAL/REX DUAL F BOILER CASINGS AND CONTROL PANEL

#### STACKED BOILERS

For stacked boilers, 2 kits are supplied: the standard kit for the upper boiler and a special kit for the lower boiler. The main difference is the control panel support stave (1) to be mounted where preferred and the two closing frames (2) supplied in lieu of the upper staves (3) which are not applicable.

NOTE: For installation, please refer to the manual of the individual boiler. In the figure, all lags are already inserted, but before closing the upper corners on the manhole side, the control panel is to be installed along with the relevant bulbs, as described below.

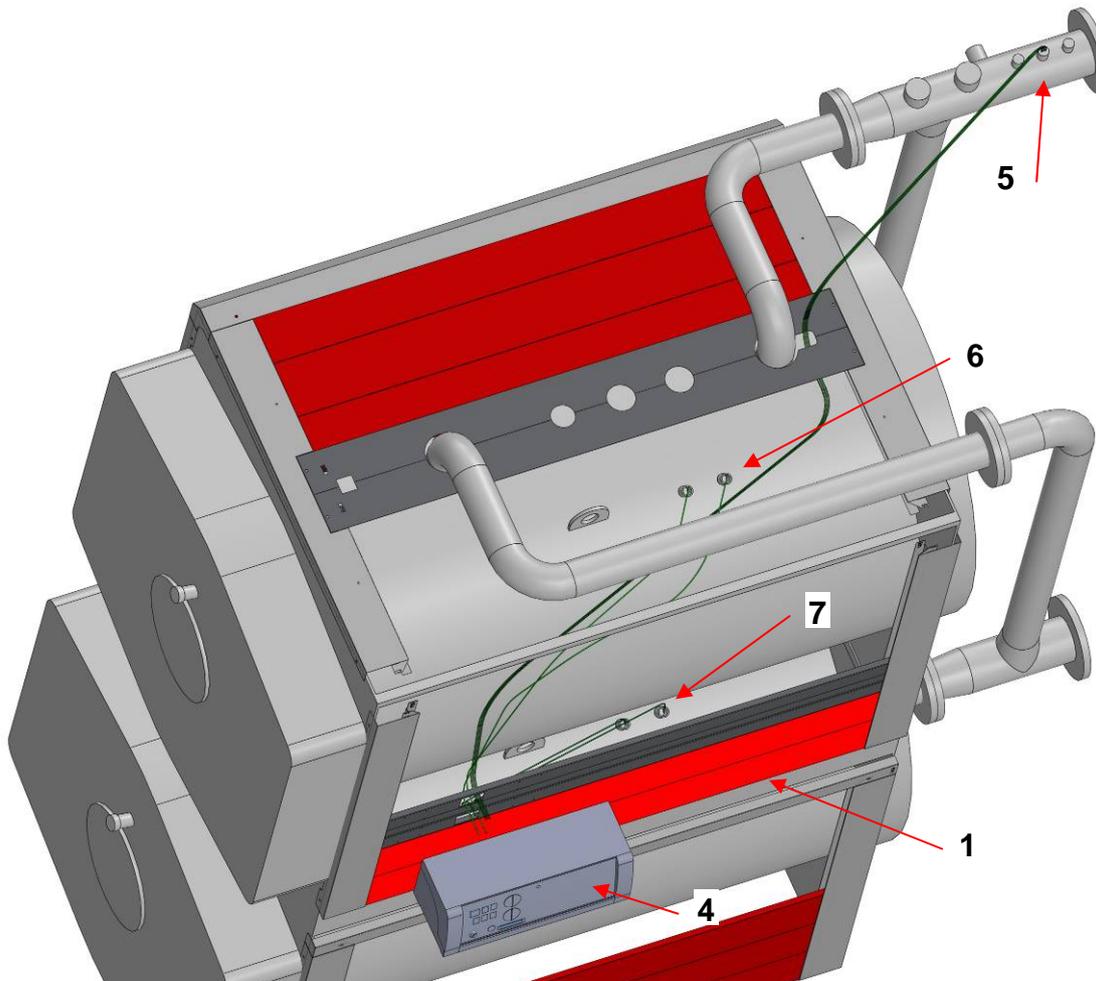

---

## CONTROL PANEL INSTALLATION

*NOTE: the control panel picture is purely indicative as it may vary according to the type of panel installed.*

- 10) Place the control panel (4) close to the panel-holding lag (1) and insert the adjusting thermostats capillary tubes of the 1st and 2nd boiler with thermometer through the openings provided. They must be inserted into the manholes of the flow pipe (5); then the safety thermostat and the circulator consent thermostat of the 1st boiler into the manholes on the shell (6); finally, the safety thermostat and the circulator consent thermostat of the 2nd boiler into the manholes on the shell (7).

- 11) Fasten the control panel (4) onto the lag (1) using the screws provided.
- 12) Finish inserting the lags and installing the closing profiles using the self-tapping screws on the manhole side, as shown in point 9).

## SIDE BY SIDE BOILERS

For combined boilers, 2 standard kits are provided. The installation process is the same as the one described for single boilers. For the positioning of the boiler's bulbs see par. 3.2.3.

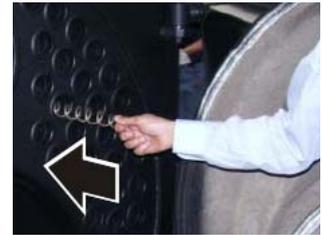

## 7 START UP

**WARNING:** Before start up, open the door and insert wholly turbolators into the front end sections of the smoke tubes, ensuring that they have been pushed inside for at least 100 mm.

### 7.1 PRELIMINARY CHECKS

Before starting the boiler, check that:

- The **rating plate** specifications and power supply network (electricity, water, gas or fuel oil) specifications correspond;
- The burner **power range** is compatible with the power of the boiler;
- The boiler room also contains the instructions for the burner;
- The **flue gas exhaust pipe** is operating correctly;
- The **air inlet supply** is well dimensioned and free from any obstacle;
- The **manhole**, the **smokebox** and the **burner plate** are closed in order to provide a complete flue gas seal;
- The system is **full of water** and that any **air pockets** have therefore been eliminated;
- The **anti-freeze** protections are operative;
- The water **circulation pumps** are operating correctly.
- The expansion vessel and the safety valve(s) have been connected correctly (with no interception) and are properly operating.
- Check the electrical parts and thermostat operation.

### 7.2 WATER TREATMENT

The most common phenomena that occur in heating systems are:

#### - Scaling

Scale obstructs heat transfer between the combustion gases and the water, causing an abnormal increase in the temperature of the metal and therefore reducing the life of the boiler.

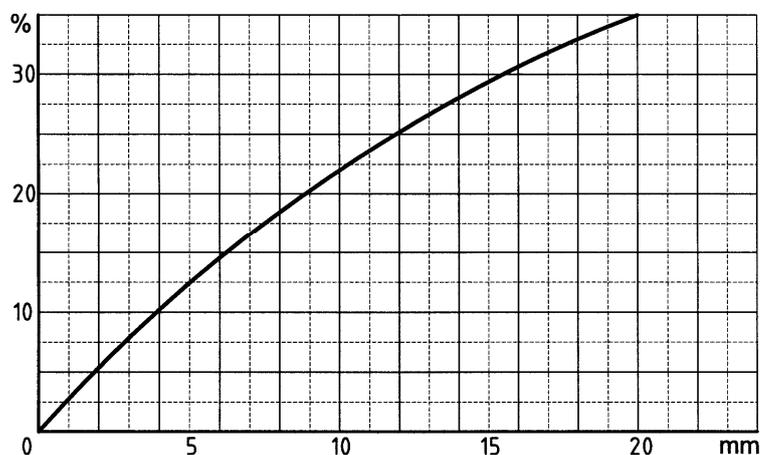

Scale is found mostly at the points where the wall temperature is highest and the best remedy, at construction level, is to eliminate areas that overheat.

Scale creates an insulating layer which reduces the thermal transfer of the generator, affecting system efficiency. This means that the heat produced by burning the fuel is not fully exploited and is lost to the flue.

#### Scale diagram

##### Key

% % fuel not used  
mm mm scale

#### - Corrosion on the water side

Corrosion of the metal surfaces of the boiler on the water side is due to the passage of dissolved iron through its ions (Fe+). In this process the presence

of dissolved gases and in particular of oxygen and carbon dioxide is very important. Corrosion often occurs with softened or demineralised water which has a more aggressive effect on iron (acid water with Ph <7): in these cases, although the system is protected from scaling, it is not protected against corrosion and the water must be treated with corrosion inhibitors.

### 7.3 FILLING THE SYSTEM

**The water must enter the system as slowly as possible and in a quantity proportional to the air bleeding capacity of the components involved. Filling times vary depending on the capacity and characteristics of the system but should never be less than 2 or 3 hours.**

In the case of a system with closed expansion vessel, water must be let in until the pressure gauge indicator reaches the static pressure value pre-set by the vessel.

Heat the water to maximum temperature. During this operation the air contained in the water is released through the automatic air separators or through manual bleed valves. The water discharged from the system with elimination of the air is made up by the automatic or manual filling valve.

## 8 OPERATION

### 8.1 OPERATING CHECKS

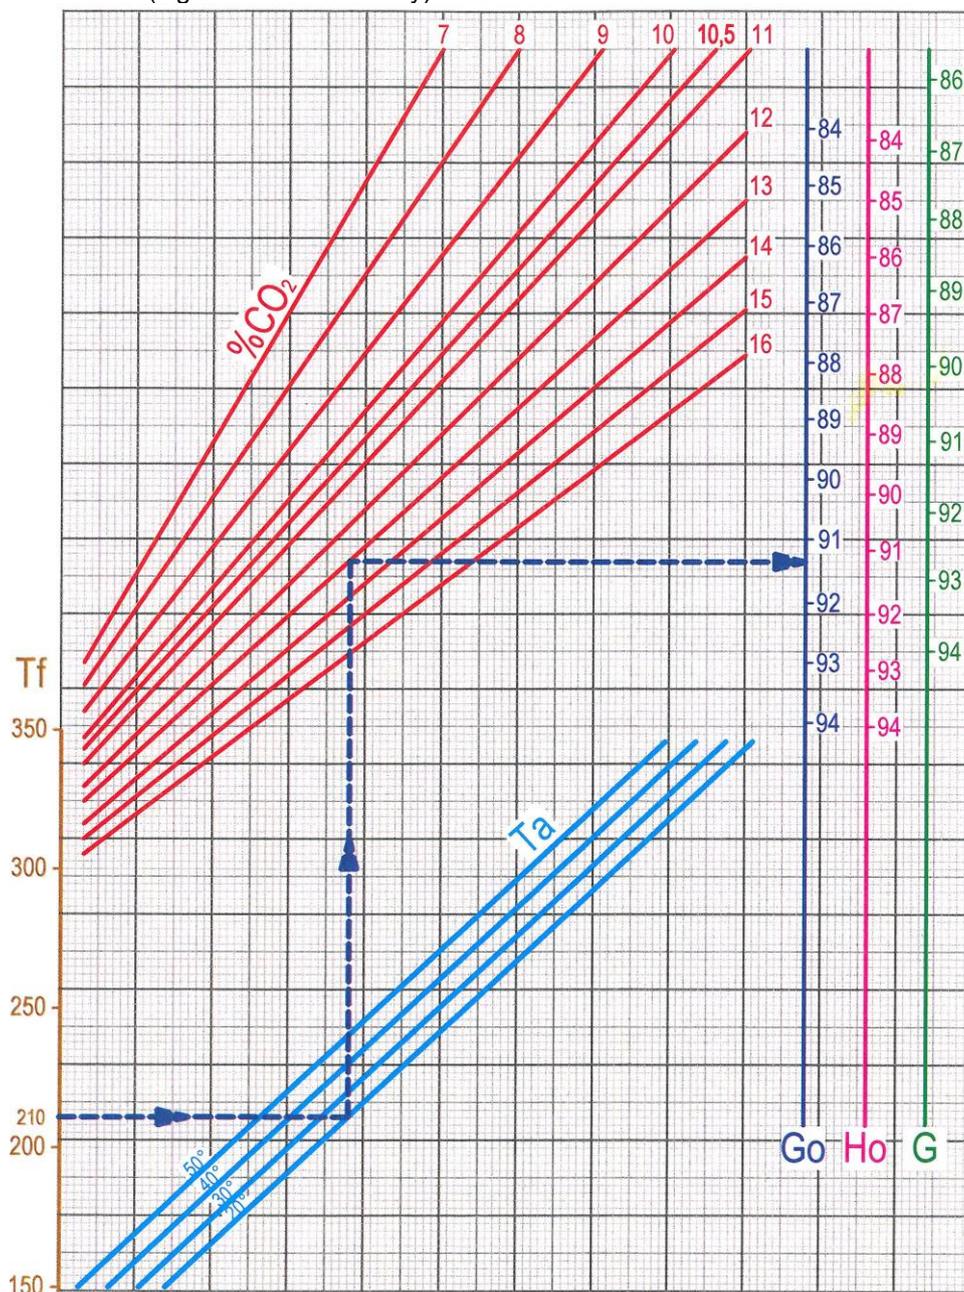

The heating system must be correctly operated to ensure perfect combustion as far as possible with reduced emissions of carbon monoxide, unburnt hydrocarbons and soot into the atmosphere, and to avoid hazards and damage to people and goods. Guide to combustion values:

FUELS	%CO <sub>2</sub>	Flue gases temperature	% CO
Gas	10	190°C	0 – 20 ppm
Gas oil	13	195°C	10 – 80 ppm
Heavy oil	13.5	200°C	50 – 150 ppm

A diagram is provided in which the system efficiency is obtained according to the flue gas temperature, the ambient temperature and the percentage of carbon dioxide (CO<sub>2</sub>). Dispersions through the boiler casings are not considered.

Example:  
 Flue gas temperature.....210 °C  
 Ambient temperature.....20 °C  
 %CO<sub>2</sub>.....13 %  
 Fuel used .....GAS OIL  
**Efficiency.....91.4 %**

% EFFICIENCY CHART (significant losses only)

Key:

**Tf** Flue gas temperature – **Ta** Ambient temperature °C – **Go** Gas oil – **Ho** Heavy oil – **G** Gas

---

Pressurisation values should be included in the range given in the table of technical specifications.

**IMPORTANT**

**The delta T between flow and return must not exceed 30°C, in order to avoid thermal shocks in the boiler. The boiler return temperature must be higher than 50°C on natural gas or LPG firing and higher than 40°C on oil firing, in order to protect the boiler from corrosion due to acid flue gas condensation; the guarantee therefore does not cover damages due to condensation. If the system return temperature does not fulfill the above requirements, it is necessary to increase the return temperature by using a mixing valve and/or a recirculation pump.**

It is necessary to keep the burner switch always switched on in order to maintain water temperature equal approximately to the value set through the thermostat.

If the flue gas seal is poor in the front part of the boiler (manhole and burner plate) or the back part (smokebox), the closing tie rods of the individual parts must be adjusted; if this is not sufficient, the seals must be replaced.

**CAUTION**

**Do not open the manhole and do not remove the smokebox while the burner is working. Always wait few minutes after the burner has been switched off until the insulating parts are cooler.**

---

## 9 MAINTENANCE

### IMPORTANT

Carry out thorough cleaning and periodic maintenance to ensure a correct and safe operation of the system. A perfectly clean tube bundle increases the thermal exchange between fumes and water contributing to energy saving and reducing air pollution.

### 9.1 PREPARATION FOR INSPECTION AND MAINTENANCE

Before carrying out any kind of maintenance, in order to avoid risks, the operator must be equipped with all the personal protection provided by the standards in force.

Before performing any cleaning and maintenance operation, it is first necessary to disconnect the device from both the fuel and the mains supply.

Maintenance must be entrusted only to **technically qualified personnel** and can be either mechanical or electrical.

The preparation and status of the generator may be different, depending on the operations to be performed:

- **With the boiler running**, to check the integrity of the generator when hot (fume trace seal, water side gasket seal, flue draught, operation of adjustment and safety accessories),
- **With switch-off and complete cooling** of the generator, when having to open the front door with inspection inside the furnace and fume chamber.
- **With cooling, complete emptying and safe shut-off of the generator** towards the system of use, in the case of water side internal visit.

Particular precautions must be taken to avoid the risk of electric shock since the system on the generator has accessories powered at 230V and/or at 400V.

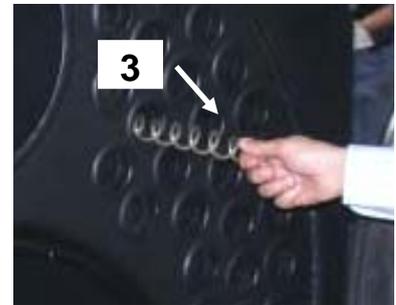

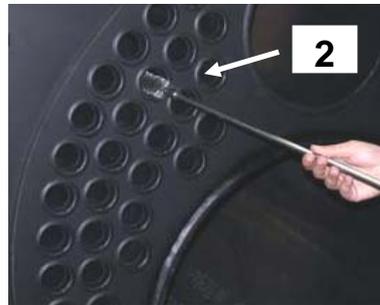

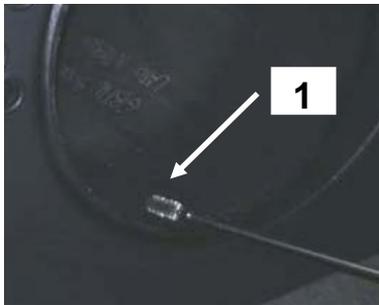

Before intervening on the generator, ensure that the connection to the electrical system has been made according to current standards, also ensuring proper earthing connection to the system.

---

## 9.2 ORDINARY

- Carry out burner maintenance (as to the specific instructions) and have the calibration checked by duly qualified personnel.
- Check the tightness of flange bolts and the state of the gaskets;
- Analyse the system water and make sure it is treated in such a way that scaling does not occur, as scales would not only reduce the boiler performance, but also cause potentially fatal damage to the boiler in the long run.
- Make sure that refractory cladding and fume seal gaskets are intact; if they are not, replace them;
- Check the integrity of the flame warning light.
- Periodically clean the furnace (1) and the tube bundle (2) using a brush.
- Check the integrity and cleanliness of the turbulators (3), if any; in general gaseous fuels should not produce any carbon deposit while with the use of liquid fuels, it is necessary to clean frequently to avoid substantial fouling.
- To clean more thoroughly, the smoke chamber is to be removed; in this way, carbon residues can be eliminated from the back.

- Check the integrity of the electrical system on the generator.
- Check the integrity of the electrical panel, both outside (IP protection) and inside (check of all components inside the electrical panel).
- Periodically check the efficiency of adjusting and system safety tools.
