

## The Modupak multi boiler package for custom-made performance

The Stokvis Modupak can be installed in a very short time and comes complete with boilers, pumps, header, manifolds, dirt and air separator, valves, insulation, flue and control system.

Almost unlimited configurations of boiler size and number are possible as well as the type of Modupak, whether it be located against a wall free-standing, or back to-back.

The Modupak can be made up from a selection of any of the six R40 EVOLUTION boiler models available in the capacity options 56kW, 65kW, 75kW, 93kW, 112kW and 130kW (80/60°C)

Up to eight boilers can be combined with one another in a cascade operation. In practice, the Modupak solution allows for high-precision adjustment of the output capacity to match the seasonal load.

The R40 EVOLUTION is robust and compact and due to the modular format of the Modupak the units can be assembled and installed in the tightest of plantrooms and also sections can be transported to the plantroom that have the narrowest of access routes.

With the modular format, boilers with a total capacity of up to 1,102 kW can easily be located into the smallest areas.

For full details of the Modupak options please see the full technical manual.
